

Campus Flow Final Project Report

Student: ZHU FUXIN / シュフシン / M25W7195

Campus Flow is a Spring Boot classroom web project for a student daily-life dashboard. It combines profile management, weather and country information, MySQL persistence, JWT/OAuth API checks, Docker sidecar deployment, and deployment documentation.

Current Maintenance Summary

On 2026-06-25, I simplified the frontend so the project stays clear for classroom presentation. The four-season theme switcher and unused image placeholder path were removed. The existing background assets remain, but the page no longer depends on manual theme switching. GSAP animation code was moved into ui-effects.js and reduced to lightweight entrance, hover, and save-feedback effects.

Verification Result

Check	Result
Maven package build	Passed
Docker Compose app image rebuild	Passed
campus-flow-app	Running on localhost:8080
campus-flow-mysql	Healthy
/	200 OK
/index.html	200 OK
/api/profile	200 OK
/api/home?country=Japan&city=Kyoto	200 OK
/api-docs.html	200 OK

Screenshots

Repository Note

The local folder was not a Git repository during this work, and GitHub CLI was not installed. The project has been prepared for packaging, and PROJECT_HISTORY.md records the project history until a GitHub repository is available.
